PROBLEM STATEMENT

ID - EDU-1004

- The shift to online education has led to a **significant rise** in academic **dishonesty**, with many students leveraging **AI-powered tools** like **ChatGPT** to **cheat** during exams and assignments, compromising the integrity of remote assessments. A study published in Research Square found that prior to the COVID-19 pandemic, **29.9%** of students self-reported cheating in online exams. This figure increased to **54.7%** during the pandemic, highlighting a **substantial rise** in **online exam cheating**.
- Existing proctoring systems struggle to effectively identify a wide range of cheating activities, including **face spoofing**, **background noise** indicating **multiple people**, and **suspicious browser behaviors**, leading to missed detection and unfair testing environments. The Hechinger Report notes that during the surge in online testing, proctoring capacities were overwhelmed, resulting in many online test-takers being unmonitored.
- There is a growing need for a **more advanced**, automated proctoring solution that can monitor **not only browser activity** but also, **video** and **audio activity**, providing a more comprehensive approach to ensuring the integrity of online exams.

OUR SOLUTION - WATCHDOG

Web-based Analytics for Test Cheating Detection & Online Governance

Monitors Browser Activity

Performs Face Scan to prevent Face Spoofing

Uses Webcam and Microphone Capture to Detect Malpractices

Test Score Validation

Post Exam Review of Cheating Cases

OUR ACCOMPLISHMENTS

Advanced AI Integration

Our system uses advanced AI models for **real-time face recognition** and **spoofing detection**, ensuring that the **registered candidate** is **present** throughout the exam.

Multimodal Monitoring

We combine **webcam**, **microphone**, and **browser activity monitoring** to create a comprehensive proctoring solution that detects a **wide range** of **cheating** behaviors.

Head Pose Estimation

Beyond traditional face detection, we also assess the **candidate's gaze direction**, which helps **identify potential cheating attempts** like looking away to access external help.

Comprehensive Reports

An **integrity score** will be generated for each **test-taker** based on their **behaviour**. After the test concludes, a **detailed report** will be generated for each user, allowing institutions to **review snapshots** of **moments** when the test-taker was **flagged** for **suspicious activity**.
